

1. Install Docker; deploy and run applications

1. Install docker

1) Install docker (on ubuntu)

<https://www.digitalocean.com/community/tutorials/how-to-install-and-use-docker-on-ubuntu-20-04>

2) install docker compose (on ubuntu)

<https://www.digitalocean.com/community/tutorials/how-to-install-and-use-docker-compose-on-ubuntu-20-04>

3) Setup kafka zookeeper/broker using docker (optional)

<https://www.conduktor.io/kafka/how-to-start-kafka-using-docker>

.create folder ~/docker_kafka and navigate to this folder

.Run following command to download docker-compose yaml files

git clone <https://github.com/conduktor/kafka-stack-docker-compose.git>

(We will not use these yaml files. But they can be used for reference)

2. Deploy applications

- .Create folder ~/docker_kafka if not existing
- .Deploy following files to ~/docker_kafka:
 - docker-compose_kafka.yml (for starting zookeeper and kafka broker)
 - docker-compose_kafka-g.yaml (for executing generator application)
 - docker-compose_kafka-d.yaml (for executing detector application)
- .Create folder ~/docker_kafka/generator. Deploy following 3 files created for the generator:
 - Dockerfile
 - app.py
 - requirements.txt
- . Create folder ~/docker_kafka/detector. Deploy following 3 files created for the detector:
 - Dockerfile
 - app.py
 - Requirements.txt

2. Prepare for running applications

1) . Start Kafka zookeeper and broker .

Navigate to folder `~/docker_kafka` and run:
`$docker-compose -f docker-compose_kafka.yml up`

2) Build images

- .Build docker image for the generator
Navigate to folder `~/docker_kafka` and run:
`docker-compose -f docker-compose-g.yml build`
- .Build docker image for the detector
Navigate to folder `~/docker_kafka` and run:
`docker-compose -f docker-compose-d.yml build`

3) Create topics

```
kafka-topics.sh --zookeeper localhost:2181 --topic queueing.transactions --create  
--partitions 1 --replication-factor 1
```

```
kafka-topics.sh --zookeeper localhost:2181 --topic legit_topic --create --partitions 1  
--replication-factor 1
```

```
kafka-topics.sh --zookeeper localhost:2181 --topic fraud_topic --create --partitions 1  
--replication-factor 1
```

3. Start generator/consumer applications

.Start detector (after start, it will be running and waiting)
docker-compose -f docker-compose-d.yaml up

.Start generator application
docker-compose -f docker-compose-g.yaml up

4. Results

Screenshot; The generator generated fake transactions and sent to a topic on the broker:

```
chu@DESKTOP-NV1A40E:~/docker_kafka$ docker-compose -f docker-compose-g.yaml up
WARNING: Found orphan containers (kafka1, docker_kafka_detector_1, zoo1) for this project. If you removed or renamed
command with the --remove-orphans flag to clean it up.

```

Screenshot2: The fraud detector receive the the transaction messages from the broker and identify if they are suspicious or not and send messages to fraud_topic/legit_topic on the broker

```
